Subject: Pesticide insecticides help
Attachments: ATT00001.txt

Hey Joe,

We got some data from the wet cake at AltEn (see below) sampled by Nebraska Dept of AG. Looks to have some detectable insecticides and pesticides. They are currently land applying this stuff which give us some concern but that is being worked out in our land division. My main concerns for the air is that they want to BioChar this wet cake and will the insecticides or pesticides be released into the air? Next is how do I test it (methods). I have talked with EPA RTP on this and no great method. But we might be able to do a sorbent trap method and GC. Then what happens if we see something what is the thresholds? I'm a little stuck if I don't have a limit or standard. I searched each compound and I didn't see any of these on the HAP list. Or does this fall under the FIFRA team.

Thanks
Brad
